

Interview

Overview

We plan to conduct a semi-structured interview in which we will show participants sets of screenshots and prototypes of consent interfaces being designed for an online healthcare platform. We will ask them to imagine tasks that could be performed with those interfaces, explain steps they would take to perform certain actions, describe their understanding of information shown in those prototypes, and give us feedback on what they are shown.

This is part of a design process, and so we may iterate on these prototypes from interview to interview. Participants may be shown different versions of these prototypes from exactly what is attached here. Those versions will all be similar in their purposes as consent interfaces for the online healthcare platform. They may vary on dimensions such as the following:

- Visual interface elements such as colors, fonts, types of selection mechanisms (buttons, menus), position of elements
- Informational text
- Order of steps
- Platform: e.g., may vary whether the interface prototype is shown as it would appear on a mobile phone screen or as it would appear on a desktop or laptop computer

Participants will not be asked any questions that would ask them to reveal sensitive, personal, or health-related information. They will be explicitly asked at the start of the interview not to respond in ways that reveal such information. If a participant does reveal such information over the course of the interview, we will redact overly personal or identifiable information from any recordings, transcripts, or quotations that might be used in analysis or made public in research publications or shared datasets.

Protocol

Contact

We'll generally email participants from [email address].

When giving participants email links to contact us (e.g., from Calendly), we'll direct them to [email address] to make filtering emails easier.

Recruitment & Screening

1. Recruitment posts placed on Craigslist and/or our participant pool
2. From there, individuals will complete the screening survey by visiting this link:
3. We will review screening results as they come in and invite participants, with efforts made to balance the sample demographically when possible
4. When a participant is invited:
 - a. Their email and first name will be added to a contact list in Qualtrics
 - b. A unique identifier will also be generated in the Qualtrics contact list: we'll use this to label their data. **This must be entered by adding them to the Chatbot Study contact list in Qualtrics and adding "ChatbotStudyID, [identifier]" to the embedded data in their contact info**
 - c. We will send them a unique consent form link via Qualtrics mailer
5. After completing the consent form, they will be shown the calendar link, as well as automatically emailed (via Qualtrics mailer) a reminder to fill it out
6. Participants will be able to select a 45-minute time slot in Calendly
7. Participants will receive a confirmation email from Calendly. This will let them cancel or reschedule

Individuals will complete the screening survey, which includes eligibility questions as well as basic demographics. From the pool of eligible individuals, we will invite a diverse sample of about 20 people to participate in the interviews. Invited participants will be sent the consent form link.

After screening / Before interview

Participants will receive a copy of the consent document in an advance email and will be asked to answer a set of questions confirming their eligibility and consent. Participants will also be given a link at this time to sign up for a time slot.

After signing up, participants will receive a secure Zoom link, including a password, in advance of the interview. They will be asked to make sure that Zoom is set up on their computers and that screen sharing is enabled before the time of the interview. We will include links to instructions for this.

Zoom setup

Participants will be asked to join the call at a pre-scheduled time.

Consent

We will greet the participants and read the consent review/summary shown below.

Thank you so much for signing up to assist us with our study of online healthcare information tools. You filled out a consent form in advance when you scheduled your

interview: do you have any questions about that information? *[We will also be prepared to [show](#) the full “in advance” consent form above for them to re-read if they wish]*

[After answering any questions they have] Just to make sure all of the important details are fresh, I'll summarize the important parts of that consent information again.

My name is _____. This study is run by [PIs] in [our research org].

This will last 30 to 45 minutes. In this interview, we will ask you questions about your computer and internet use, and we will also show you images of designs for a website and for online tools and ask you questions about those images.

We will be recording audio and video from the interview. We only record video so that when we analyze this later we can see what image was shown on the screen at any point in the conversation, so we don't need your camera to be on. You are welcome to turn it on if you wish, if that feels more comfortable for you, but be aware that your face will then be recorded on the video file. *[can change “turn it on” to language like “leave it on” here if they have already turned video on]*

The audio and video will not be shared with people outside of our team, but we will be transcribing what is said during the interviews, and that may be shared in a way that will not be connected to you personally.

Please try not to reveal any information in your responses that would reveal something that is identifiable and private about you or anyone else. An example of something that would be both identifiable and private would be saying a family member's name while also mentioning a medical condition that they have. If you accidentally do reveal something personal, that part of the transcript will be removed before the transcript is shared.

Your participation is completely voluntary, so if you wish to stop the interview or don't want to answer a particular question, you can tell me that at any time.

When we're done, you'll receive a \$15 Amazon gift code.

Do you have any other questions before we get started?

Are you in a quiet, private location so that we can avoid accidentally recording anyone else who might be nearby?

Is it okay if I start recording now?

We will start the Zoom audio/video recording only after confirming that participants are willing to be recorded.

-One person run Zoom cloud recording, one run Quicktime recording

We will emphasize at the start of the interview and in any questions related to healthcare tools that participants should not reveal sensitive healthcare information. We are simply interested in asking questions related to, for example, whether they have used health insurance or PHR websites frequently, infrequently, or not at all in the past.

Intro questions

This is not a fully structured interview, since this is exploratory research.

Initially, we will ask questions including the following:

- **How frequently do you use the internet?**
- **What type of device do you use the internet on most frequently? (Computer, smartphone, tablet, other)**
- **Do you use any websites or apps to keep track of healthcare information, such as doctor's appointments or health insurance info? (Please do not tell us sensitive healthcare details—we are just interested to know whether you have used these types of websites a lot, a little, or not at all.)**
- (If they do use them) **What websites/apps?**
- (If they do use them) **What do they use them for?**
- (If they do use them) **How long have you been using those sites?**
- (If they do use them) **How frequently do you log into them?**
- (If they do use them) **Do you find them easy or hard to use? Why?**

We will then explain that we are testing designs for a new tool that allows users to talk to a “chatbot” to get answers to questions about their health insurance.

We'll ask them to open one of the following links and then explain how to share their screen (just the relevant window):

- V1 chatbot:
<https://xd.adobe.com/view/925803ca-a179-4734-ae59-e8461c20c7e9-c70b/?fullscreen&hints=off>

Scenario 1

We will ask participants to share their screens at this time, and we will send them links to open the images that we are getting feedback on. This will allow users to use their cursors to gesture at parts of the images that they are referring to. As a backup option if participants have technical

difficulties with this, we will share these images from our own screens, which will still allow users to view and give feedback on them.

We are going to look at the website for HealthCo, which is a fictional health insurance company. This website allows HealthCo's insurance customers to sign in to get information about their insurance plans.

We'll look at this website together, and I'll have you go through the steps that you would go through if you wanted to use the chatbot in this scenario. As you proceed, think out loud as much as you can about what you are seeing and what choices you are making. We'll stop on each page and discuss what you see before clicking any options.

As we do this, I want to encourage you to give honest feedback. I didn't design this prototype, and it won't hurt my feelings if your feedback is critical. Your feedback is part of a design process that helps us weed out good ideas from bad ones, so we really want to know what works, what doesn't work, and whether you have any other ideas about what would work better.

Scenario

Imagine that you tripped while hiking last week and injured your ankle. At first, you thought it was just a minor sprain, but it is still really painful when you walk, and you are wondering if it is more serious. Since it's painful but not an immediate emergency, you want to make sure that you go to a doctor that is covered under your insurance and want to be able to budget for how much it may cost to visit the doctor and get an X-ray. You would like to use the Healthco chatbot to find out what your insurance will cover, how much of the cost your insurance will pay for, and what provider would be covered.

Upon showing each image, we will ask questions including and related to the following, asking the participant to vocalize their internal thought process:

- **What do you notice first on this page?**
- **What options do you have on this page?**
- **If you wanted to proceed to use the chatbot, what option would you select?**
- **What would you expect to happen when you exercise that option? (e.g., click that button)**
- **Is there anything that is especially useful about this page?**
- **Is there anything that is especially confusing about this page?**
- **(When there is crucial text on the page) How would you summarize this text? What do you think this means?**

- **Note: On v1 of the prototype, which has the “View Resources” button, we should make sure to ask what they think “View Resources” means**
- **Based on the scenario we talked about, how would you proceed here?**

Whenever a user indicates that they would perform an action or click a button that leads to a different page in the flow of these interface prototypes, we will show them the image of the view that would be shown next, and ask a similar set of questions there.

After they have reached the point where they can use the chatbot:

- **Would you feel comfortable using this tool?**
- **Who, or what companies, would you expect to have access to the questions you typed while talking to this tool?**
- **If they notice the Google Cloud detail, ask if they would feel differently about a different company (Amazon, different division of HealthCo, Facebook, etc)**
- **(If not already apparent) How do you think the answers shown to you by the chatbot are created? Do you think that a computer responds automatically, that a human chats with you in real time, or something else?**

Revoking consent

After they have gone through the flow of prototypes for initially authorizing the use of the tool, we will also show them the interface for revoking consent and ask similar questions about that process.

Imagine that after asking the chatbot some questions, you have changed your mind about whether you are comfortable using this tool. What would you do next?

If they don't find the Revoke Consent button themselves, follow up on whatever path they say they would take, but then ask what they think that button would do

Have them click it and ask what they think the speech bubble text means

Then ask them what they think would happen if they clicked Revoke Consent

Have them click it, ask what they would do next

Ask what they think would happen after they clicked yes

-Do they think they would be able to use the chatbot anymore?

-Do they think any more data would be sent to Google in the future?

-What do they think would happen to any information that was already sent?

Final questions

At the end of the interview, we will ask them a final set of questions including and related to the following:

- **Overall, what did you think of these designs? (easy, simple, confusing, too complicated, etc.)**
- **Were there any particular parts that stuck out to you as confusing?**
- **Do you have any other thoughts or feedback?**

STOP RECORDING / stop screen share

Final steps

- We will email the participant the \$15 Amazon gift code and confirm that they have received it
- We will ask participants if they would like to be emailed about future study opportunities similar to this one.
